

KHB TECHNOLOGIES

Finance Operations Analytics

A Consulting Case Study on Revenue Growth, Cash Collection, and Credit Risk Management

Prepared By: Harsh

Tools Used: SQL · Microsoft Excel · Power Pivot · DAX

Data Analytics Portfolio Project

Executive Summary

KHB Technologies, an enterprise technology supplier of industrial machinery, computer hardware, networking equipment, and business technology products, has grown revenue substantially over the past fiscal year. That growth, however, has not been matched by an equivalent improvement in cash realisation. A review of order-level, customer-level, and branch-level finance data was undertaken to understand why, and to translate the findings into a set of concrete actions for the finance leadership team.

The investigation revealed that the gap between billed revenue and collected cash is not random. It concentrates in a identifiable group of customers, a handful of underperforming branches, a small set of sales representatives, and a few product lines where discounting has quietly eroded margin. This report walks through how that conclusion was reached, what it means operationally, and what KHB Technologies should do about it — in the near term and over the next several years.

1. Project Motivation

Finance operations at growing technology companies rarely fail because revenue is weak. They fail because the systems for tracking who owes what, and for how long, do not keep pace with the speed of sales. This project was built to address that exact gap: to take raw order, customer, and payment data and turn it into a decision-making tool that a CFO or finance controller could genuinely use — not a demonstration of SQL syntax, but a working diagnostic of where cash is getting stuck and why.

The choice of SQL, Excel, Power Pivot, and DAX was deliberate. These are the tools most finance and analytics teams already have in place, and the objective was to show that meaningful, decision-grade insight does not require an enterprise BI platform to get started — only a disciplined analytical process applied to the data a company already collects.

2. Company Background and Business Scenario

KHB Technologies serves Enterprise, Government, and SMB clients across four regions — East, North, South, and West — with a product portfolio spanning industrial machinery, hardware, networking equipment, and Apple Mac solutions. Revenue is generated across Finance, Healthcare, IT, Manufacturing, and Retail-sector clients, giving the business a reasonably diversified top line.

Over the past year, finance leadership flagged a recurring concern during monthly reviews: revenue on paper kept climbing, but the amount of cash actually landing in the bank was not climbing at the same pace. Outstanding balances were being carried longer than expected, and no one on the team could say with confidence which customers, branches, or products were driving the gap. That uncertainty was the starting point for this analysis.

3. Consulting Methodology

The engagement followed a structured, top-down approach rather than jumping straight into query-writing. Business questions were defined first, based on the concerns finance leadership had already raised, and every subsequent step — data preparation, analysis, and dashboard design — was built to answer those questions directly.

4. Business Problems

The diagnostic phase of this project was designed to separate what KHB Technologies can control from what it cannot. On the controllable side, several patterns emerged that point directly to internal process gaps rather than external market conditions.

- A concentrated group of high-revenue customers were also the most frequent late payers, meaning the company's largest accounts are also carrying some of its largest collection risk.
- Certain high-volume product lines were generating strong top-line sales while contributing very little profit, largely because of discount levels extended at the point of sale.
- Some of the highest-billing sales representatives also managed the largest share of overdue accounts, suggesting collection quality was not being weighed alongside revenue performance.
- Collection discipline varied meaningfully across branches, with a visible gap between the best- and worst-performing locations.
- A subset of customers had already moved close to, or past, their assigned credit limits once recent purchasing trends and outstanding balances were factored in together.
- A backlog of ageing invoices had accumulated without a consistent method for prioritising which ones to chase first.

Collectively, these findings emphasize that the underlying issue is not a shortage of revenue — it is a lack of visibility into where collection risk is concentrated, and a lack of consistency in how that risk is managed once it appears.

5. Business Constraints

Not every factor influencing collection performance sits within KHB Technologies' control, and any recommendation put forward in this report has been shaped around the following realities.

- Broader credit market conditions and customer liquidity cycles, which move independently of anything KHB Technologies does internally.
- Contractual payment terms already in place with several Enterprise and Government accounts, which cannot be altered mid-term.
- Competitive dynamics in the hardware and networking equipment space, which limit how aggressively discounting practices can be tightened without risking deal volume.
- Seasonal variation in demand across the year, which naturally affects monthly revenue and collection patterns.
- Regulatory and compliance requirements attached to credit extended to government-sector clients.
- General macroeconomic conditions affecting customer cash flow, and therefore payment timeliness, that sit well outside the company's sphere of influence.

6. Business Assumptions

A small number of working assumptions were applied to keep the analysis consistent and interpretable, given the nature of the underlying dataset.

- Revenue is recognised on the order date, and cash collection is recognised on the payment date.
- Customer credit limits are treated as constant over the analysis period, in the absence of a recorded credit-limit revision history.
- Bad debt is treated as representing invoices considered unrecoverable as of the last available data point.
- The dataset reflects a single financial period, and year-over-year comparisons were not attempted beyond the stated revenue growth rate.

7. Project Objectives

Short-Term (0–3 months)

Build a prioritised, evidence-based worklist of the customers and invoices most in need of collection follow-up, so that finance and account teams are working from the same view of risk.

Medium-Term (3–12 months)

Bring collection performance across branches and sales representatives to a consistent standard, and bring the average collection period down toward a level more typical of the B2B technology sector.

Long-Term (1–3 years)

Move the organisation from reviewing credit risk after the fact to anticipating it — through customer risk scoring, predictive payment-delay signals, and real-time reporting embedded into the regular finance operating rhythm.

8. Data Preparation and Data Cleaning

Before any analysis could be trusted, the underlying order, customer, and product data needed to be brought into a consistent, reliable state. This stage is often the least visible part of an analytics project, but it is where most of the eventual accuracy of the findings is actually decided.

Standardising region values

Regional labels across the customer table were inconsistently entered in places, which would have caused the regional analysis to under- or over-count certain territories. Standardising these values first ensured that regional comparisons — such as repeat late-payment rates by region — were reliable rather than an artefact of inconsistent labelling.

Handling missing payment dates

A number of orders carried no recorded payment date, typically reflecting invoices that remain unpaid. These records were treated deliberately rather than dropped, since excluding them would have understated the true scale of outstanding and overdue balances.

Validating customer and product keys

Every order record was checked against the customer and product master tables to confirm that each transaction could be reliably linked back to a named customer and product. Unmatched or orphaned records would otherwise have introduced silent gaps into the revenue and profitability figures.

Removing duplicate records

Order records were checked for duplication to prevent revenue and payment activity from being counted more than once, which is a common and easily overlooked source of overstated performance in finance datasets.

Building a calendar table

A dedicated calendar table was constructed to support consistent month-over-month and trend-based analysis — this is what allows the monthly revenue, collection, and outstanding-balance trends to be compared on a like-for-like basis rather than relying on inconsistent date groupings.

Developing DAX measures

Core financial metrics — total revenue, gross profit, collection rate, outstanding amount, and bad debt rate — were built as reusable DAX measures rather than static calculations, so that every view in the dashboard recalculates consistently when filtered by segment or region.

9. Executive Dashboard Insights

The dashboard layer was designed around six management themes rather than a checklist of individual charts, so that each view answers a specific leadership question.

Figure 1: Finance Department Dashboard — KHB Technologies

Figure 2: Executive Dashboard — KHB Technologies

Revenue Performance

Business Objective: understand where revenue is being generated and whether growth is broad-based or concentrated.

Key Findings: revenue is fairly well spread across the Finance, IT, Healthcare, and Manufacturing verticals, with year-on-year growth strong overall.

Management Interpretation: the company's top-line performance is healthy and not overly dependent on a single sector, which is a genuine strength to build on.

Recommended Action: continue current sector diversification while directing collection improvement efforts at the specific customers and branches identified later in this report.

Potential Business Impact: sustained, diversified revenue growth that is not offset by rising collection risk.

Collection Performance

Business Objective: assess how efficiently billed revenue is being converted into collected cash.

Key Findings: roughly seven out of every ten rupees billed are ultimately collected, and the average time to collect a payment runs longer than is typical for the sector. Once a payment slips past its initial due window, it is considerably more likely to become a long-outstanding balance than to be settled shortly after.

Management Interpretation: the business does not have a small, manageable tail of late payments — it has a meaningful, structural collection gap that compounds over time if left unaddressed.

Recommended Action: introduce earlier intervention triggers for accounts approaching the 30-day mark, rather than waiting until they are already significantly overdue.

Potential Business Impact: improved cash flow predictability and a shorter cash conversion cycle.

Credit Risk

Business Objective: identify which customers pose the greatest exposure relative to their assigned credit limits.

Key Findings: a defined group of customers, when recent purchasing momentum and outstanding balances are considered together, have already moved past their credit limit or are on a clear trajectory to do so.

Management Interpretation: credit exposure at KHB Technologies is currently being discovered after the fact rather than anticipated, which limits the finance team's ability to act early.

Recommended Action: adopt the forward-looking credit exposure view built into this analysis as a standing monthly check rather than a one-off exercise.

Potential Business Impact: fewer instances of customers trading beyond their approved credit exposure, and reduced bad-debt risk.

Regional Performance

Business Objective: determine whether collection issues are localised or systemic.

Key Findings: repeat late-payment behaviour is close to evenly distributed across all four regions, with no single region standing out as an outlier.

Management Interpretation: this is best understood as a company-wide behavioural and process pattern rather than a regional one, which changes how it should be addressed.

Recommended Action: pursue a unified, national credit policy rather than region-specific fixes.

Potential Business Impact: consistent credit standards and a simpler policy to administer and monitor.

Customer Behaviour

Business Objective: understand which customers combine high value with high risk.

Key Findings: a small number of named accounts consistently appear among both the highest-revenue and highest-delay customers, and several of them are also repeat late payers rather than one-time exceptions.

Management Interpretation: these accounts matter enough to revenue that they cannot simply be deprioritised, but they cannot continue to be managed on standard terms either.

Recommended Action: move these specific accounts onto structured payment plans or revised terms, coordinated between sales and finance.

Potential Business Impact: reduced concentration risk without sacrificing the revenue these accounts contribute.

Operational Performance

Business Objective: evaluate consistency in collection execution across branches and sales representatives.

Key Findings: performance varies more than expected between the best- and worst-performing branches and representatives, indicating the gap is about process discipline rather than an unavoidable market condition.

Management Interpretation: because strong performers already exist within the network, the underperformance elsewhere is a solvable execution issue, not a structural limitation.

Recommended Action: use the top-performing branches and representatives as an internal benchmark for the rest of the network.

Potential Business Impact: a measurable lift in collection rates simply by closing the internal performance gap that already exists today.

10. Business Questions & Analytical Findings

Each of the following questions was posed the way finance leadership would naturally ask it, and answered by working through the underlying order, customer, product, and payment data. The emphasis throughout is on what the finding means for decision-making, not on how the query was constructed.

Which customers contribute the most revenue while also delaying payment the most often?

A	B	C
customername	total_revenue	total_delay_payments
Customer_11	662769.24	5
Customer_239	545852.46	2
Customer_76	525560.43	2
Customer_809	507860.35	1
Customer_768	506410.25	1
Customer_868	480820.78	4
Customer_8	472727.24	6
Customer_323	471284.33	5
Customer_952	466162.51	2
Customer_6	461815	1

Figure 3: Top revenue customers with recorded payment delays

Customer-level revenue was reviewed alongside a count of how often each customer's payments arrived more than thirty days late. A clear pattern emerged: several of the accounts contributing the most revenue are also among the most persistent late payers, with one account alone recording six separate delayed payments. From a management perspective, this means the company's largest customers are not automatically its safest ones, and revenue size should not be used as a proxy for payment reliability when account terms are being set.

Which products generate strong sales but weak profitability once discounting is accounted for?

product	sum	profit	discount
Product_1	1091514	23675.66	114107.4
Product_3	731985.4	30095.41	68369.73
Product_9	565139.2	19265.24	66223.32
Product_8	502468.8	3638.8	60566.03

Figure 4: High-sales, low-profit products driven by discounting

A review of product-level sales, cost, and discount data identified a small group of high-volume product lines where sales figures looked strong on the surface but profit margins were substantially thinner once the value of discounts extended to close each sale was factored in. In at least one case, discounting had reduced what should have been a strong-margin product down to only marginal profitability. Operationally, this implies that sales volume targets on these specific product lines are currently being met at the expense of margin, and a tighter discount-approval process on just these products would protect profitability without requiring any broader pricing change.

Are the highest-revenue sales representatives also the ones managing the most overdue accounts?

A	B	C
total_revenue	salesrep	late_collection_count

Figure 5: Sales representative revenue against late-collection activity

To evaluate sales effectiveness beyond pure revenue generation, representative performance was compared against the payment behaviour of the customers they manage. The investigation revealed that the representative bringing in the highest revenue also carried the highest number of late collections of anyone on the team, and this was not an isolated case — several of the top revenue earners showed a similar pattern. One notable observation is that this is a coaching and incentive-design opportunity rather than a performance problem: these representatives are clearly capable of driving revenue, and the same relationship-management skill can be redirected toward collection quality if it is explicitly built into how performance is measured.

Which branches show the weakest collection discipline?

A	B
branch	late_collection
Branch_6	175
Branch_8	158
Branch_2	157
Branch_4	151
Branch_3	149
Branch_7	146
Branch_10	141
Branch_5	141
Branch_9	141
Branch_1	128

Figure 6: Branch-level late-collection performance

Branch-level data showed a meaningful spread between the strongest and weakest performers on collection discipline, with the gap between the best and worst branch running to roughly a third in relative terms. Because this gap exists within a single organisation operating under the same policies, it points toward inconsistent local execution rather than a structural constraint — and strong performers already within the network can serve as a practical, internal benchmark for the rest.

Which customers are on track to exceed their credit limit in the near term?

customerid	customername	month_date	creditlimit	avq_sales	outstanding	remainingcredit
1	Customer_1	2024-03-01 00:00:C	50000	51249.26	0	50000

Figure 7: Forward-looking credit exposure by customer

Rather than waiting for a credit breach to be discovered after the fact, a rolling three-month average of customer purchasing activity was combined with current outstanding balances to estimate near-term credit exposure. This approach surfaced several customers who have either already moved past their assigned limit or are on a clear trajectory to do so within the coming month. Evidence points toward this being a genuinely useful early-warning capability: it allows the credit-control function to intervene proactively, rather than reacting once an account is already over its limit.

In which periods does revenue rise while cash collection falls behind it?

paymentdate	month
20-10-2024	10
14-05-2024	5
09-12-2025	12
22-05-2025	5
18-12-2025	12
11-12-2025	12
30-04-2024	4
29-12-2024	12
NULL	NULL
04-09-2025	9

Figure 8: Monthly date mapping supporting the revenue-versus-collection trend

Monthly revenue and monthly cash collection were tracked against one another to identify periods where the two diverge — where billed revenue increases but the cash actually collected does not keep pace. This divergence is visible directly in the Executive Dashboard's monthly trend views, and it represents, in many respects, the clearest single piece of evidence in this entire analysis: revenue growth at KHB Technologies is currently outrunning the finance team's ability to convert that growth into cash, and closing that gap should be treated as a standing priority rather than a one-time fix.

Which outstanding invoices should the finance team act on first?

orderid	invoicedate	duedate	one_month_over	overdays

233	30-01-2025	01-03-2025	TRUE	503
251	27-07-2024	26-08-2024	TRUE	690
273	28-11-2025	28-12-2025	TRUE	201
275	09-12-2024	08-01-2025	TRUE	555
277	19-01-2024	18-02-2024	TRUE	880

Figure 9: Overdue invoices ranked by age past due date

Pending invoices were filtered down to those that are both unpaid and more than thirty days past their due date, then ranked by how long they have been outstanding. Some of these invoices have remained unresolved for well over a year. These findings emphasize the value of a single, objectively ranked workload: rather than finance staff prioritising collection calls informally, the team now has a consistent, evidence-based order in which to work through the backlog, starting with the oldest and most material balances.

Do certain regions show a stronger pattern of repeat late payment than others?

A	B	C	D
region	repeat_late	total_late_customers	repeat_late_percentage
West	119	203	58.62
South	103	179	57.54
North	107	186	57.53
East	115	200	57.5

Figure 10: Repeat late-payment concentration by region

Customers who had been late on more than one occasion were compared against the full population of customers who had ever been late, broken down by region. The four regions showed almost

identical repeat-late-payment rates, all clustering closely together rather than any one region standing apart. A deeper review identified this as strong evidence that repeat late payment is a company-wide behavioural pattern embedded in how credit is currently extended and followed up, rather than something driven by regional economic conditions — which argues for a single, unified credit policy rather than region-by-region intervention.

11. Solution

The recommended path forward combines two things the analysis has already made visible: which accounts carry the most risk, and which parts of the organisation are best equipped to manage that risk consistently. The highest-revenue, highest-delay customers, together with those approaching their credit limits, should be moved onto a structured, actively managed collection track within the next collection cycle, using the ranked overdue-invoice list as the starting point. At the same time, the clear performance gap between branches and representatives should be closed by extending the practices of the strongest performers to the rest of the network, supported by a consistent scorecard rather than informal oversight.

Taken together, this directly addresses the core issue identified earlier — that revenue growth is currently outpacing cash collection — by working both sides of the problem at once: who owes the money, and who inside the organisation is accountable for collecting it.

12. Alternate Solution

Where renegotiating terms with an existing account is not immediately practical — most notably with Government clients bound by standing contracts — a lighter-touch alternative is available. Rather than reopening existing agreements, tightened terms can be applied only to new orders placed by customers already flagged as high-risk, such as requiring partial advance payment or a shortened credit period on future transactions. This preserves existing contractual relationships exactly as they stand while still meaningfully reducing the rate at which new risk is added to the book.

13. Recommendations

Immediate (0–3 months)

- Direct the ranked overdue-invoice list to account managers, prioritising the highest-revenue customers already flagged as chronic late payers.
- Launch a weekly collections review specifically for the lowest-performing branches identified in this analysis.

Medium-Term (3–12 months)

- Introduce a consistent collection scorecard across branches and sales representatives, benchmarked against current top performers.
- Apply differentiated credit terms to high-risk accounts, using the alternate-solution approach where existing contracts limit renegotiation.
- Introduce a discount-approval threshold for the specific product lines shown to carry the greatest margin erosion.

Long-Term (1–3 years)

- Develop a predictive payment-delay and customer risk-scoring capability to shift credit management from reactive to anticipatory.
- Migrate reporting into a real-time platform with automated alerts for customers nearing credit-limit thresholds.

14. Business Impact

Implemented together, these recommendations are expected to shorten the cash conversion cycle and improve working-capital efficiency, reduce bad-debt exposure below its current level, and give finance leadership earlier visibility into credit risk rather than discovering it after the fact. Sales performance management stands to improve as collection quality is built into how representatives are evaluated, and the standardisation of practice across branches should narrow today's performance gap without requiring additional headcount. None of this requires any change to KHB Technologies' underlying revenue strategy — the objective is to make the revenue already being generated convert into cash more efficiently and more predictably.

15. Project Limitations

- The dataset used for this analysis is simulated rather than drawn from a live production system.
- The analysis is historical in nature and does not incorporate predictive modelling.
- No external economic or market indicators were incorporated into the credit-risk assessment.
- The available time horizon limits the ability to observe multi-year seasonal or cyclical trends.

16. Future Enhancements

- Migrate the dashboard layer to Power BI for richer interactivity and broader distribution across the finance function.
- Introduce machine-learning-based payment prediction to anticipate late payment before it occurs.
- Develop a formal customer risk-scoring model incorporating a wider set of behavioural and financial signals.
- Add forward-looking revenue and collection forecasting rather than historical trend review alone.
- Move toward real-time dashboards with automated alerting for accounts approaching credit thresholds.
- Integrate the analysis into a cloud data warehouse to support larger data volumes and faster refresh cycles.

17. Business Value Delivered

This project demonstrates how a disciplined analytical process — starting from a genuine business concern, not a dataset — can turn scattered order and payment records into a clear, decision-ready view of financial risk. The value delivered here is not the SQL written or the dashboard built; it is the fact that KHB Technologies' finance leadership now has a defined, evidence-based answer to a question they could not previously answer with confidence: where, specifically, is cash getting stuck, and what should be done about it first.

For an organisation, that translates into faster, better-informed decisions about which customers to extend trust to, which branches need support, and where pricing discipline needs to be tightened. For a finance function, it means moving from reactive firefighting on overdue accounts to a structured, prioritised, and repeatable process. That shift — from data to decision — is the core value this engagement was designed to deliver.

Technical Skills Demonstrated

SQL

- Multi-table joins across customer, order, and product data
- Common table expressions for layered, readable analysis
- Window functions for trend and period-over-period comparison
- Aggregation and grouping for revenue, profit, and collection metrics
- Ranking and prioritisation logic for invoice and customer worklists
- Conditional (CASE-based) categorisation of payment status
- Date-based calculations for ageing, delay, and trend analysis

Excel and Power Pivot

- Power Pivot data modelling across related tables
- DAX measure development for reusable financial KPIs
- Pivot table-based summarisation and cross-tabulation
- Dashboard design and layout for executive consumption
- KPI development, including collection rate, bad debt rate, and outstanding exposure

Business and Consulting Skills

- Finance operations and working-capital analysis
- Revenue and profitability analysis
- Customer credit-risk assessment
- Executive reporting and dashboard storytelling
- Structured business problem-solving and recommendation development
- Translating technical findings into management-ready language
